

Rack PDUs

The Raritan Dominion PX range of rack power distribution units allows real-time remote power monitoring of current (amps), voltage, power (kVA, kW) and energy consumption (kWH) with ISO/IEC $\pm 1\%$ billing-grade accuracy.

The series has hundreds of models suitable for data centre applications including models with outlet switching, individual outlet metering, high power for blade servers and high-density applications and 400 V power distribution.

The company's power management solutions allow data centre and facilities managers to make informed capacity planning decisions, to efficiently use power resources, improve uptime and staff productivity, save power and measure PUE, and drive green data centre initiatives.

With this series, real-time, accurate power monitoring and metering is available - down to the individual outlets that servers plug into. It provides active and apparent power and also accurately measures and tracks energy usage (kWH), provides remote switching of outlets and alerts upon preset power and environment events.

In addition to reliable distribution of power, the range is environment monitoring ready to accept the company's plug-and-play environment probes and sensors.
